In essence, DNS is simply a database that links meaningful names (known as host names ), such as http://www.microsoft.com, to a specific IP address, such as 192.168.124.1. Simply linking addresses to names is just the beginning, though, because DNS has many more features in addition to host-name-to-address mapping.

DNS: What It Is and What It Does - dummies  
The DNS system consists of many Domain Name servers that together provide the name to IP address mapping for registered devices (usually servers) on the Internet. The main DNS servers (root servers) are owned and managed by a variety of different organizations, and are located mainly in the USA. Here is a list http://www.iana.org/domains/root/servers.

queries through: Recursive DNS Servers (or Caching Servers, sounds like "caching") and Authoritative Servers (what DNS Made Easy provides). In a nutshell, Authoritative DNS servers store the " maps " of your domain names to IP addresses. This domain name to IP mapping is usually configured by system administrators.
