Dynamic Prediction in Clinical Survival Analysis summarizes cutting-edge research on the dynamic use of predictive models with traditional and new approaches. Aimed at applied statisticians who actively analyze clinical data in collaboration with clinicians, the analyses of the different data sets throughout the book demonstrate how predictive models can be obtained from proper data sets.

In contrast, Dynamic Prediction in Clinical Survival Analysis focuses on dynamic models for the remaining lifetime at later points in time, for instance using landmark models. Designed to be useful to applied statisticians and clinical epidemiologists, each chapter in the book has a practical focus on the issues of working with real life data.

prediction of disease trajectories is critical for early identification and timely treatment of patients at risk. Conventional methods in survival analysis are often constrained by strong parametric assumptions and limited in their ability to learn from high-dimensional data.

information is used for predictions as it becomes available. Local recurrence and distant metastasis are included in the model.

Dynamic prediction of overall survival for patients with ...

Patients who have had a metastasis or died before this landmark timepoint are excluded from the analysis. Dynamic prediction can be achieved by performing landmark analysis for different landmark fixed timepoints.

Dynamic prediction methods in the BC2001 clinical trial

Dynamic personalized prediction models can guide treatment decisions and provide personalized information for patients. Our application illustrates the utility of the landmarking approach for making the best use of longitudinal and survival data and shows how models can be defined and compared in terms of predictive performance.

Dynamic Prediction in Clinical Survival Analysis 1st ...
Dynamic prediction has an intuitive expression associated with the estimated probability of event occurrence within $(t, t + w)$, assuming that the patient is at risk at prediction time t . For univariate survival outcomes, this probability can be calculated using the Breslow estimator based on Cox proportional hazards models [2].

Dynamic prediction of repeated events data based on
