It is widely accepted in the scientific community that climate change is a reality, and that changes are happening with increasing rapidity. In this second edition, leading climate researcher Barrie Pittock revisits the effects that global warming is having on our planet, in light of ever-evolving scientific research. Presenting all sides of the arguments about the science and

possible remedies, Pittock examines the latest analyses of climate change, such as new and alarming observations regarding Arctic sea ice, the recently published IPCC Fourth Assessment Report, and the policies of the new Australian Government and how they affect the implementation of climate change initiatives. New material focuses on massive investments in large-scale renewables, such as the kind being taken up in California, as well as many smaller-scale activities in individual homes and businesses which are being driven by both regulatory and market mechanisms. The book includes extensive endnotes with links to ongoing and updated information, as well as some new illustrations. While the message is clear that climate change is here (and in some areas, might already be having disastrous effects), there is still hope for the future, and the ideas presented here will inspire people to take action. *Climate Change: The Science, Impacts and Solutions* is an important reference for students in environmental or social sciences, policy makers, and people who are genuinely concerned about the future of our environment.

This book evaluates local conservation successes of global south in the climate milieu, as an empirical evidence of 'Bio-rights' of commons at community-ecosystem interface for sustainable intensification of

nature's goods and services. Bio-rights is a right-based neo-economic conservation paradigm that compensates the opportunity costs incurred in conservation efforts by the marginal communities, living near globally important ecosystems and dependent on it for their livelihood, through payments from environment services. The book would bring forth the true value of circular economic interventions in socio-ecological conservation, shaped through sustainable human interactions with nature. This multilevel study of conservation science serves an interdisciplinary academia, consistent with conventions on climate change, bio-diversity and sustainable development, to establish links between conservation priorities and development objectives. Herein, Bio-rights is introduced as a 'design approach' for production linked sustainable development, supplemented with case studies from the east.

In this New York Times bestseller, Brian Fagan shows how climate transformed-and sometimes destroyed--human societies during the earth's last global warming phase. From the 10th to 15th centuries the earth experienced a rise in surface temperature that changed climate worldwide-a preview of today's global warming. In some areas, including much of Western Europe, longer summers brought bountiful crops and population growth that led to cultural

flowering. In others, drought shook long-established societies, such as the Maya and the Indians of the American Southwest, whose monumental buildings were left deserted as elaborate social structures collapsed. Brian Fagan examines how subtle changes in the environment had far-reaching effects on human life, in a narrative that sweeps from the Arctic ice cap to the Sahara to the Indian Ocean. The lessons of history suggest we may be yet be underestimating the power of climate change to disrupt our lives today.

In Philadelphia, nothing is the same after a deadly shooting has everyone on edge and revenge is in the air.

For generations, the ground beneath the feet of our ancestors seemed solid and unchanging. Around 30 years ago, two things happened that were to revolutionize the understanding of our home planet. First, geologists realized that the continents themselves were drifting across the surface of the globe and that oceans were being created and destroyed. Secondly, pictures of the entire planet were returned from space. As the astronomer Fred Hoyle had predicted, this 'let loose an idea as powerful as any in history'. Suddenly, the Earth began to be viewed as a single entity; a dynamic, interacting whole, controlled by complex processes we scarcely understood. It began to seem less solid. As one astronaut put it, 'a blue jewel on black velvet; small,

fragile and touchingly alone'. Geologists at last were able to see the whole as well as the detail; the wood as well as the trees. This book brings their account up to date with the latest understanding of the processes that govern our planet. One of Vox's Most Important Books of the Decade New York Times Editors' Choice 2017 Forbes Top 10 Best Environment, Climate, and Conservation Book of 2017 As new groundbreaking research suggests that climate change played a major role in the most extreme catastrophes in the planet's history, award-winning science journalist Peter Brannen takes us on a wild ride through the planet's five mass extinctions and, in the process, offers us a glimpse of our increasingly dangerous future Our world has ended five times: it has been broiled, frozen, poison-gassed, smothered, and pelted by asteroids. In *The Ends of the World*, Peter Brannen dives into deep time, exploring Earth's past dead ends, and in the process, offers us a glimpse of our possible future. Many scientists now believe that the climate shifts of the twenty-first century have analogs in these five extinctions. Using the visible clues these devastations have left behind in the fossil record, *The Ends of the World* takes us inside "scenes of the crime," from South Africa to the New York Palisades, to tell the story of each extinction. Brannen examines the fossil record—which is rife with

creatures like dragonflies the size of sea gulls and guillotine-mouthed fish—and introduces us to the researchers on the front lines who, using the forensic tools of modern science, are piecing together what really happened at the crime scenes of the Earth's biggest whodunits. Part road trip, part history, and part cautionary tale, *The Ends of the World* takes us on a tour of the ways that our planet has clawed itself back from the grave, and casts our future in a completely new light.

“Enough smoothly crafted suspense to keep readers turning pages long after dark.”—*The Seattle Times* Beyond the sparkling Hawaiian beaches, masked by the deceptive beauty of the rainforest, evil awaits sixteen-year-old Michael Sundquist and his mother, Katharine, and anthropologist who has come to the Islands to study the unusual skeletal remains unearthed on the volcanic flanks of Halekala, Maui. Yet far below the black depths of the Pacific a mysterious substance snakes through undiscovered fissures in the ocean floor, as nature itself seems to portend the terror to come. Then, with the sudden, unexpected death of Michael's friend, a disturbing truth dawns: the corporation that is funding Katherine's dig has a far greater investment than she ever imagined—an investment in medical terror. And her son may be part of their hideous grand plan. . . . “A suspenseful thriller . . . provocative . . .
