Curl is generally considered to be the tendency of paper or paperboard to curl or roll up in the cross machine direction, usually in response to changes in relative humidity (RH).

This is often referred to as “ CD curl ” .

Machine direction curl (MD) is often called “ roll set curl ” . Curl tendency can be measured using a variety of sample sizes and sample orientations.

copy papers is measured using a sheet splitting method and

hygroexpansivity is determined using an ultrasonic sheet tester.

Curl behavior of the paper is well described by the model equations. In particular it can be explained, why the CD curl and the diagonal curl in the examined papers show great differences.

~~INVESTIGATING PAPER CURL BY SHEET SPLITTING~~

Paper curl is caused by an excess amount of moisture in the paper.

The first step to ensure less paper curl is to store your paper in a cool, dry area. By doing so, you will reduce the amount of moisture and humidity the paper is exposed to.

Paper Curl Test

The paper will curl with the valley or axis of curl in the grain direction since most of the expansion is in the cross-grain direction. This test works best with sized papers because the water penetrates the paper slowly enough to cause a difference in expansion rates between the two sides.
