measured (See Figure 2.1). For example, RTDs (Resistance Temperature Devices) are typically 100Ω or 1000Ω . Thermistors are typically 3500Ω or higher.

RESISTANCE OF POPULAR SENSORS

INTRODUCTION - Analog Devices

Except for IC sensors, all temperature sensors have nonlinear transfer functions. In the past, complex analog conditioning circuits were designed to correct for the sensor nonlinearity. These circuits often required manual calibration and precision resistors to achieve the desired accuracy. Today, however, sensor outputs may be

compensation (CJC) techniques which will be discussed shortly. They are more linear than many other sensors, and their non-linearity has been well characterized. Some common thermocouples are shown in Figure 6.3. The most common metals used are Iron, Platinum, Rhodium, Rhenium, Tungsten, Copper, Alumel (composed

Conversely, in sensor-type measurements, R_4 may be a fixed reference, and a null occurs when the magnitude of the external variable (strain, temperature, etc.) is such that $R_1 = K \cdot R_4$. Null measurements are principally used in feedback systems involving electromechanical and/or human elements.
